

From pack to live site — the fifteen steps

Phase 1 — set up the project

1. Create a project folder on your computer — it will become your GitHub repository.
2. Copy the content folder from your pack into it: the copy, the brand file, and the photographs.

Phase 2 — design with Google Stitch

3. Open Google Stitch and start a new project.
4. Upload `stitch-brief.md` and paste the master prompt; Stitch generates all five screens.
5. Judge each screen with the five questions; ask for one testable change at a time until the screens pass.
6. Download the export — a zip with one folder per screen, plus `DESIGN.md`.

Phase 3 — arrange the design files

7. Save `DESIGN.md` in the project root, keeping its name.
8. Create a folder called `design` in the project root.
9. Move the five screen images into `design` and rename each to the page it becomes: `index.png`, `menu.png`, `catering.png`, `about.png`, `visit.png`.

Phase 4 — build, ship, and check

10. Open your AI (artificial intelligence) app and point it at the project folder — or upload the files if you use a chat website.
11. Paste the build prompt; the AI writes the five HTML pages and one stylesheet, and copies the photographs into an `images` folder.
12. Review the pages against the rules in the prompt; quote any failed rule back and ask for only that fix.
13. Push the project folder to a GitHub repository.
14. Import the repository on Vercel and deploy.
15. Open the live URL (web address) on your phone and your laptop, run the checklist, fix the worst failures, deploy again, and submit your URL.
